

# LARVENOL<sup>4GR</sup>

GRANULAR LARVICIDE  
FOR THE TREATMENT OF LIVESTOCK BUILDINGS

PROFESSIONAL USE

## Composition

S-methoprene 0.421 %

## Indications

**LARVENOL<sup>4GR</sup>** prevents the metamorphosis of fly larvae and rat-tailed maggots. The larvicidal substance, S-methoprene, acts as an insect growth regulator (IGR). It disrupts the development cycle and prevents larvae and nymphs from becoming adults, resulting in a significant decrease in the insect population.

## Instructions for use

The product is applied inside and outside livestock buildings at a dose of 30 g/m<sup>2</sup>. The product lasts for 12 weeks if the application instructions are followed. Reapply every 12 weeks. The maximum number of annual applications is six.

The product must be spread evenly over the surface of the manure or slurry by hand, with a measuring cup, or with a suitable device, such as a portable pellet applicator, according to the following protocol:

**Piggeries, stables, nurseries (pig, cattle, sheep, goat, and horse farms):**

- On slatted floors: apply on the third day after the animals are introduced. Treat the entire surface of the slurry pit. It is necessary to repeat the treatment after each manure disposal.
- Deep litter: Apply to each new layer of litter and repeat the treatment after each 10 cm increase in the litter layer.

**Poultry farms:**

- Cages (for laying hens): treat the accumulated litter (at each new 10 cm layer) under the cages.
- Deep litter: apply to each new layer of litter and repeat the treatment after each 10 cm increase in the litter layer. In the case of very dry substrates (e.g., laying hen litter), the product's effect may be slower.

Adding 100 ml to 200 ml of water per square meter to the substrate may facilitate the development of the larvicidal effect in very dry environmental conditions.

- Manure stored outdoors: should only be treated if it is placed in a sealed, insulated manure pit that meets other requirements for secure excrement storage. When treating excrement stored outdoors, apply the product at a rate of 30 g/m<sup>2</sup>. Stop treating excrement with the larvicide at least two months before spreading it and treat in the fields.

## Strengths

- Easy one-the-fly application.
- Long-lasting action of 12 weeks.
- Can be used in the presence of animals\*.

*\*Avoid direct contact with animals during application.*

## Packaging

5 kg bucket  
20 kg bucket

## Instructions for use

**PT18** - Use biocides safely. Always read the label and product information before use. Dangerous. Follow safety instructions.

The safety data sheet is available free of charge on request from the following address: [fds@lodi.fr](mailto:fds@lodi.fr). For first aid instructions, contact the nearest poison control centre. Wear gloves and wash your hands after handling.

Do not treat animals.  
Avoid direct contact with animals during application.  
Do not treat feeders or waterers.
